## Task 5: Create and Connect to a Cloud SQL Database (Google Cloud)
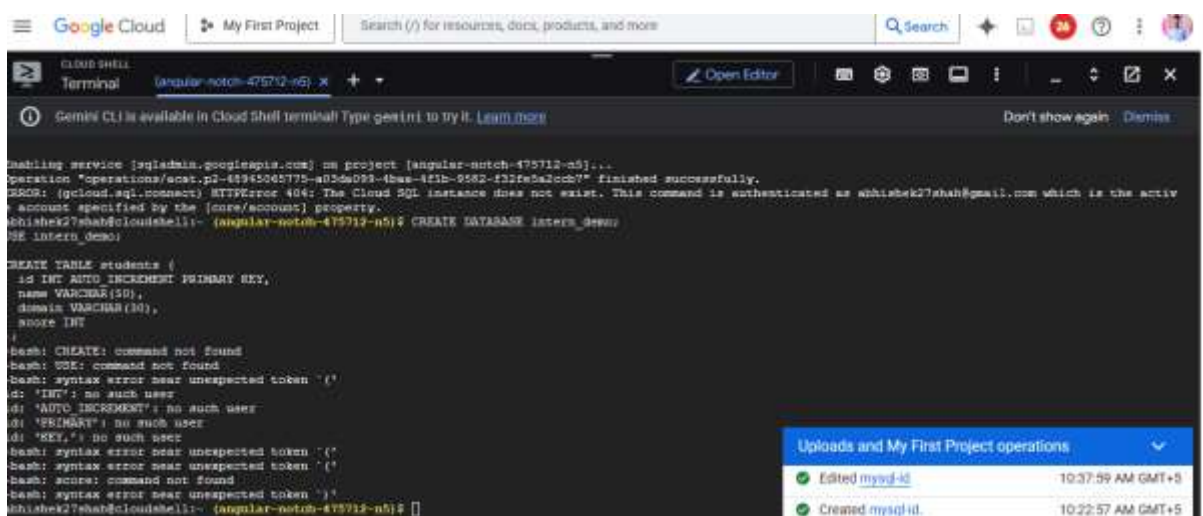

* Screenshot of your Cloud SQL instance running successfully

* Screenshot of successful connection (local or web-based)

* SQL commands used (in text or screenshot form)

* Short note explaining what you did and learned

I created a Cloud SQL instance named mysql-id on Google Cloud.

Configured public IP access and connected via Cloud Shell.
Created a database mysql-id with a students table and inserted sample records.
This task helped me understand how to provision, connect, and run SQL operations on a managed cloud database without handling server maintenance.
